

## AMENDMENT TO THE CLAIMS

The following claim set replaces all prior versions, and listings, of claims in the application:

1. (Previously Presented) Process for preparing a high-molecular weight polyamide, polyester, copolyester, copolyamide or polyester-amide block copolymer comprising melt-mixing a polyamide, polyester, copolyesters or a mixture or mixtures of a polyamide and/or a polyester having a lower molecular weight, than the polymer obtained with the process of the invention, with a diisocyanate, wherein the diisocyanate is a blocked diisocyanate having the following formula

wherein R = linear, branched or cycloaliphatic C<sub>2</sub>-C<sub>20</sub> or aromatic C<sub>6</sub>-C<sub>20</sub> and B<sub>1</sub>, B<sub>2</sub> = caprolactam, imidazole, dimethyl-pyrazole, triazole, oxim, malonic acid ester, ethylacetylacetonate, phenol, cresol, aliphatic alcohol, secondary amine, or hydroxyl benzoic acid methyl ester, and wherein the polyamide, polyester, copolyesters or a mixture of mixtures of polyamide and/or polyester having a lower molecular weight comprises amino or hydroxyl end groups.

2. (Previously Presented) Process according to Claim 1, wherein the blocked diisocyanate is present in an amount of 0.005 to 4 wt.% relative to the polyamide, the polyester, the copolyester or the mixture or mixtures of polyamide and/or polyester having a lower molecular weight.
3. (Previously Presented) Process of claim 1, wherein the melt mixing is done in an extruder.
4. (Original) Process of claim 3 wherein the extruder is a twin-screw extruder.
5. (New) Process of claim 1, wherein the molecular weight of the polyamide, polyester, copolyester or the mixture or mixtures of polyamide and/or polyester having a low molecular weight achieve a permanent increase in molecular weight within 2 minutes reaction time with the diisocyanate.
